## Tanner's destination of hides from Saanen, Alpine and Anglo-Nubian x Saanen crossbred kids

### S u m m a r y

The aim of the study was to estimate parameters defining efficiency, quality and physical properties of leathers from kids of Saanen, Alpine and Anglo-Nubian x Saanen goats. Leathers originating from six months old Anglo-Nubian x Saanen kids distinguished themselves with fullness, softness and elasticity in touch as well as by concise groins and side. These desirable properties are important during processing and forming leathers on the tops of shoes. High values of parameters defining physical properties and sensory features of examined leathers indicate their full technological usefulness and meeting a range of requirements for clothes, shoes and fancy goods.
